Fixes some irregularities with keyboard navigation + focus trap. You can replicate the current issues on your dev site by shrinking the window to trigger the mobile nav, but use your keyboard to navigate the site.

This also allows for hidden element and disabled element edge cases.

  Improve a11y of mobile nav js

Heyy @michaelbourne, thanks a lot for the effort! You are a godsend. I was actually struggling with the focus trap earlier and didn't have time to polish these things

I have now tested the changes, first try showed up some strange leftover `_5forests_theme_strings` in the code but they seemed to be gone after rebuild. Looks fine to me!

Will later add these changes to a release. Thanks again. ❤️
